

Capability Overview Presentation
Feb 2016

We just do common things Uncommonly Well

Financial Services

Web Application Development

Client situation

Client deals with millions of securities and thousands of portfolios. Market, research and transactional data is supported by multiple vendors. There are more than 5000 risk reporting runs everyday on the data fetched from at least 100 different sources including data analysis & analytical models built on traditional technologies.

Client wants functionality where it can filter out meaningful information using tags from the universe of data flowing in its environment, in a secured way.

Key services offered

- Brainstorming sessions to standardize the requirements
- Integration with legacy systems to fetch information at one place
- Robust and scalable architecture to handle huge amount of data
- Integration with robust communication library

Scope of work included

- Dumping all the data at one place in a standardized format
- Architecture robust enough to handle huge amount of data
- Understanding and integrating the new application with existing legacy systems
- Integrating communication library to create a publisher-subscriber model
- Scalability to include even chatting support for future
- Real-time flexible dashboards to monitor the flow
- Installation of load balancers to balance the real time traffic across multiple servers
- Application backend developed to support future mobile platform development

- Extensively used application for its ability to provide high level overview
- Support for sending automatic emails that can directly connect a topic to the application
